

CASE STUDY: PALLET TAG

- ❖ A three-part bar coded unit set form is used to improve the efficiency of a large warehouse.
- ❖ When a pallet filled with inventory arrives at the warehouse, product information is recorded on the form.
 - ❖ That information is then input into the company's computer network, and the bar code is scanned.
 - ❖ An adhesive backer on the form allows it to be attached to the pallet for easy identification.
 - ❖ Then, when it is time to release the pallet from the warehouse, the eye-readable bar code number is entered into the computer.
 - ❖ From the bar code, warehouse personnel will learn immediately where the pallet is located. This saves a considerable amount of time.
 - ❖ The bar coded form greatly improves the warehouse's inventory control, and the form helps save valuable time.
